SEQUEST TEST™

WHAT IS A SEQUEST TEST?

Jack's Magic[®] Sequest Test™ was developed simply to measure the amount of Jack's Magic[®] Metal Solution™ actively working to prevent and remove stains and or scale in the swimming pool.

Sequestering agents expend or are used up as they do their job. This occurs at vastly different rates depending upon the types of minerals and impurities existing in the swimming pool water. There is no practical way to gauge the amount of sequestering agent that any swimming pool will need on a weekly basis. For years, pool professionals and homeowners have just added sequestering agent on a trial and error method. With Jack's Magic[®] Sequest Test™ it gives you data you need to successfully complete a stain removal or maintain in a stain prevention program.

Jack's Magic[®] Sequest Test™ is a must for the professional doing stain removals, the builder needing stain prevention on start-up, and the retail store assisting the homeowner with stain prevention program on an ongoing basis.

NOTE

Jack's Magic[®] Sequest Test™ is designed to be used with Jack's Magic[®] Metal Solution™. Readings obtained from use of other brand sequestering agents may not be valid.

the blue stuff[®] (1 qt. METAL SOLUTION TOO) is highly effective in all pool systems. The Blue Stuff has been specially developed for pools with heaters and pools located in areas where copper or high sanitizer levels are a common water condition. The Blue Stuff was developed to be far superior at removing copper from water than any other product on the market today.

The Blue Stuff is the most recommended start up product for quartz and aggregate finishes nationwide.

the purple stuff[®] (1 qt. SALT SOLUTION) is designed to meet the demand that salt chlorine generators and high TDS (total dissolved solids) put on a sequestering agent. In addition to removing metals from the water, The Purple Stuff also helps keep silica in solution and helps prevent scaling of the cells in salt chlorine generators.

The #1 recommended preventative product for salt chlorine generator pools.

the pink stuff[®] (1 qt. METAL SOLUTION) is our original sequestering agent. The Pink Stuff is designed to prevent and help remove metallic stains by filtering metallic contaminants out of the water. In pools where copper is a known problem, The Blue Stuff[®] should be used in place of The Pink Stuff. In pools that have chlorine generators that use salt or pools that have a high TDS, The Purple Stuff[®] should be used.

ANOTHER SOLUTION BY JACK'S MAGIC®

Jack's Magic® is focused on problem solving. The best way to isolate the sources of most pool problems is through accurate testing. Jack's Magic® now produces their own test kit designed to give the pool professional accurate answers in the field.

WHY?

To be successful with the Jack's Magic® stain removal and stain prevention program, the pool professional must have the tools to accurately monitor what is taking place in the swimming pool they are treating. Jack's Magic® test kits have reagents designed specifically to work in swimming pools in real world conditions. Jack's Magic® has several exclusive formulations that other test kit reagent manufacturers don't use.

PROFESSIONAL TEST KIT

This test kit provides for six essential tests for sound basic pool water chemistry. Each test kit contains 50 tablets for each parameter for a total of 300 tests.

pH

Using a high quality comparator, the operator can easily measure pH from 6.8 to 8.2 using a single specially formulated Phenol Red tablet.

FREE AND TOTAL CHLORINE

Using the same comparator the operator can determine chlorine levels from 0.1 to 6.0 ppm by using a DPD#1 for free chlorine then adding a DPD#3 to determine total chlorine.

ALK TEST

For determining the total alkalinity 60 to 400 ppm quickly, easily, and accurately. Drop one tablet in calibrated vial,

add water until the color changes, and read the total alkalinity scale corresponding to the water level. No drops, no counting, no interference from cyanuric levels.

CAL TEST

For calcium hardness 60 to 400 ppm. Perform this test identical to Alk test. Fast and easy.

CYANURIC ACID RANGE 0 TO 400 ppm

Another specially formulated tablet to buffer out interferences that occur in the real world. Readings will be vastly different from those you were getting before. Plus this test vial allows for easy dilutions using tap water to extend your range to 400 ppm.

THE BOX

The box comes with a 2 year guarantee. An easy to open and close box using a pin hinge system and replaceable hasp. The top does not break off!

ACCESSORIES

A special low range vial for alkalinity and calcium allows you to measure down to 20 ppm. All components in this kit can be ordered individually. When ordering new tablets, make sure they come from Jack's Magic®. There is a difference.

WHY USE TABLETS?

Tablets give you consistent answers from kit to kit. Jack's Magic® guarantees all tablets 2 to 5 years unconditional shelf life. Tablets do not suffer the same degradation problems liquids do above 86°F. If a tablet's quality is compromised, you can tell visually the tablet is bad. This is not possible with liquid reagents.

Foremost, when consulting Jack's Magic® on a specific problem we need accurate answers. Unfortunately, if you are not using a Jack's Magic® Professional Test Kit, analysis of your problems may not be possible.
